

支付网关回调签名方案

商户验签步骤如下

- 1:获取回调请求请求头header里面Authorization中的sign
- 2:解析回调通知请求报文获取到请求体body
- 3:获取收钱吧公钥（请联系收钱吧相应技术对接人提供）
- 4:采用RSA的SHA256WithRSA签名算法，对获取的回调信息进行验签。
- 5:返回验签结果

Java代码示例

```
1  /**  验签
2   * @param data 签名原数据
3   * @param sign 签名
4   * @param publicKey 收钱吧公钥
5   */
6  public static boolean validateSign(String data, String sign, String
publicKey){
7      try {
8          Signature signature = Signature.getInstance("SHA256WithRSA");
9          PublicKey localPublicKey = getPublicKeyFromX509("RSA", publicKey);
10         signature.initVerify(localPublicKey);
11         signature.update(data.getBytes());
12         byte[] bytesSign = Base64.decode(sign);
13         return signature.verify(bytesSign);
14     }catch (Exception e){
15         e.printStackTrace();
16         return false;
17     }
18 }
19
20 public static PublicKey getPublicKeyFromX509(String algorithm, String
publicKey) throws Exception {
21     KeyFactory keyFactory = KeyFactory.getInstance(algorithm);
22     return keyFactory.generatePublic(new
X509EncodedKeySpec(Base64.decode(publicKey)));
23 }
```

Python代码示例

```

1  """
2  param sign: 签名
3  param body: 请求体
4  param pubKey: 公钥
5  """
6  from Crypto.PublicKey import RSA
7  from Crypto.Signature import PKCS1_v1_5
8  from Crypto.Hash import SHA256
9  import base64
10 h = SHA256.new(body) # 对请求体进行SHA256加密
11 pubKey = RSA.importKey(PUBLIC_KEY) # 获取公钥
12 verifier = PKCS1_v1_5.new(pubKey) # 创建验证
13 verifier.verify(h, base64.b64decode(sign)) # 验证签名是否一致, sign需要base64
    解密

```

C#代码示例

PHP代码示例

```

1  public function validateSign(){
2      $data = file_get_contents("php://input");
3      $sign =getallheaders();
4      $PUBLIC_KEY="公钥"; //（这里传入收钱吧提供的公钥）
5      $result = FALSE;
6      $result = (openssl_verify($data,
base64_decode($sign['Authorization']), $PUBLIC_KEY,
OPENSSL_ALGO_SHA256)===1);
7      if($result){
8          echo '验签成功';
9      }else{
10         echo '验签失败';
11     }
12 }

```
